

HELP OUR COMMUNITY REDUCE THE SPREAD OF COVID-19

COVID-19 Risk, Prevention and Treatment:

- There is no cure for COVID-19
 - Getting infected with COVID-19 is risky
 - COVID-19 is especially risky for those who are pregnant
- The benefits of getting vaccinated against COVID-19 are significant
 - Vaccines do work against the delta variant
 - Data show the vaccine is safe before, during and after pregnancy
- Getting infected with COVID-19 is far riskier than getting vaccinated
- Vaccinated immunity is preferable to immunity conferred by getting infected
- Vaccines have been preventing disease for more than 100 years
- Before they are authorized, vaccines go through many forms of independent scientific review
- The CDC and FDA continue to monitor the safety of vaccines after they are authorized
- Masking minimizes infection and transmission
